

**RFLAN**  
REDFLAG LANFEST

## FIBRE TO THE LAN PARTY

..and building a high-performance network for 24 hours.

Speakers: Brad Peczka / Tim Raphael, AusNOG 2019

- RFLAN is a self-sustaining event, founded in 2002 and operating as a registered not-for-profit since 2005.
- We're a 100% volunteer based organisation.
- Currently the largest BYOC event in the Southern Hemisphere

# ..but what's a 'BYOC' Event?

## Bring Your Own Computer!

Lanners bring their PC, monitor, peripherals... and often chairs!

# By The Numbers

	RFLAN 1	RFLAN 61
Attendees	~100	864
Duration	32 hours	24 hours
Internet Capacity	None	20Gbit
Number of Servers	3	32(ish)
Number of Staff	3	53(ish)
Number of Tournaments	10	25+
Peak Pizza™	66	120+
Prize Pool	\$500	\$15,000+
Games	Counter-Strike, Battlefield 1942, Quake III, Warcraft III, Unreal Tournament	Counter-Strike:G.O., Overwatch, Fortnite, PUBG, League of Legends, DOTA 2

# RFLAN 1 vs RFLAN 61

RFLAN 1 – Late 2002

RFLAN 61 – July 2018

# Challenges of running the network at a LAN event

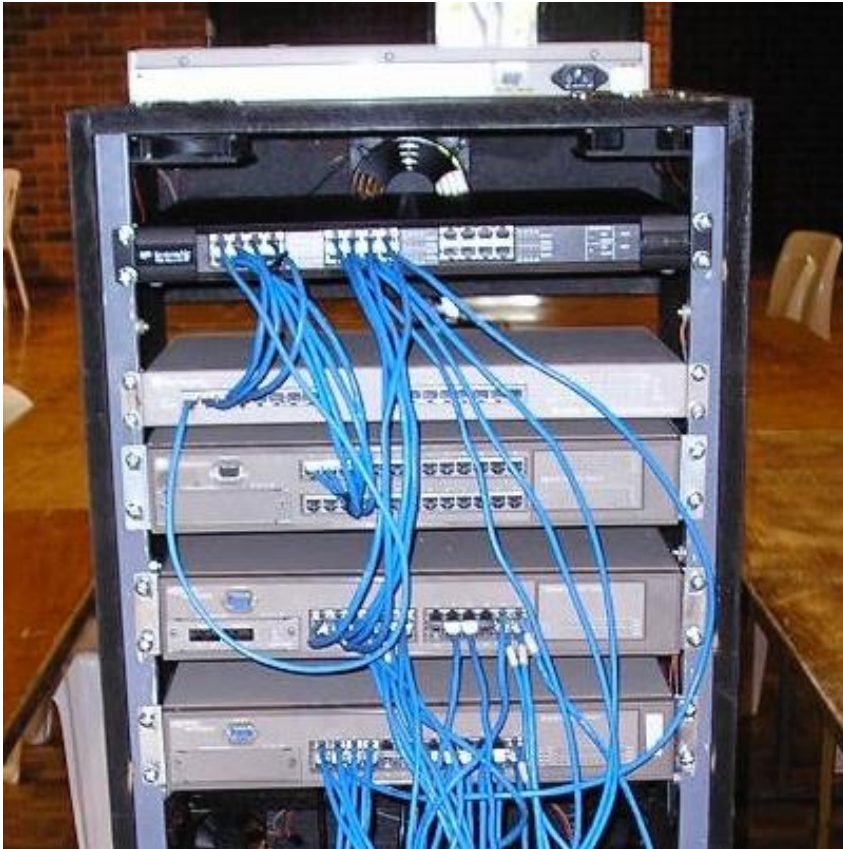

- **Gamers**
  - ISPs and readers of **Whirlpool** know what we mean...
- **Time**
  - **24 hour** event with **15 hours** to setup, **7 hours** to pack down
- **Money**
  - Not for profit, income only from ticket sales
- **Bandwidth** demand
- **Power** density
- **Hostile** technological environment
- **'Funky'** Layer 2 protocols

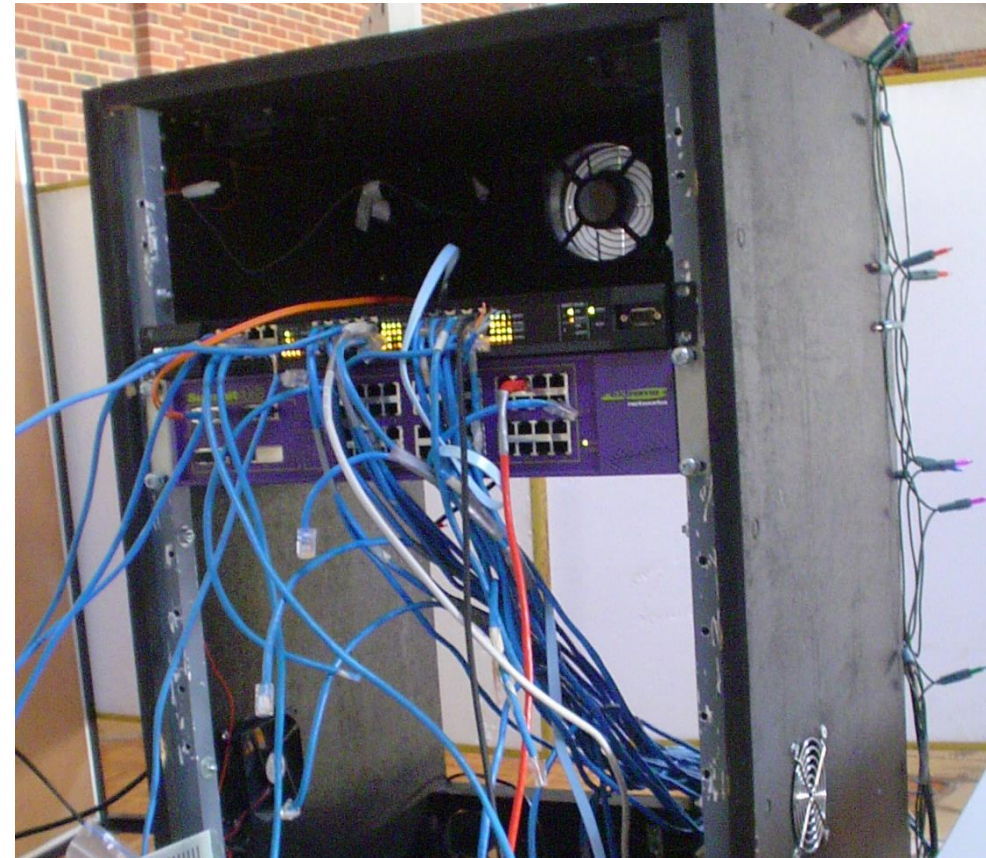

# Early Designs

Let's just lob it together!

**RFLAN 1**  
Nortel BayStack 350-24Ts

**RFLAN 10**  
Extreme Networks Summit 48

# Early Issues

## Circa 2003-2005

- One big Layer 2 domain
- No STP
- Many Loops
- Rogue DHCP
- Latency/Congestion on the uplinks
  - But no real monitoring – educated guessing...
- Power/Generators/Attendees bringing random power boards that trip whole rows of attendees

# Moving to Full Gigabit

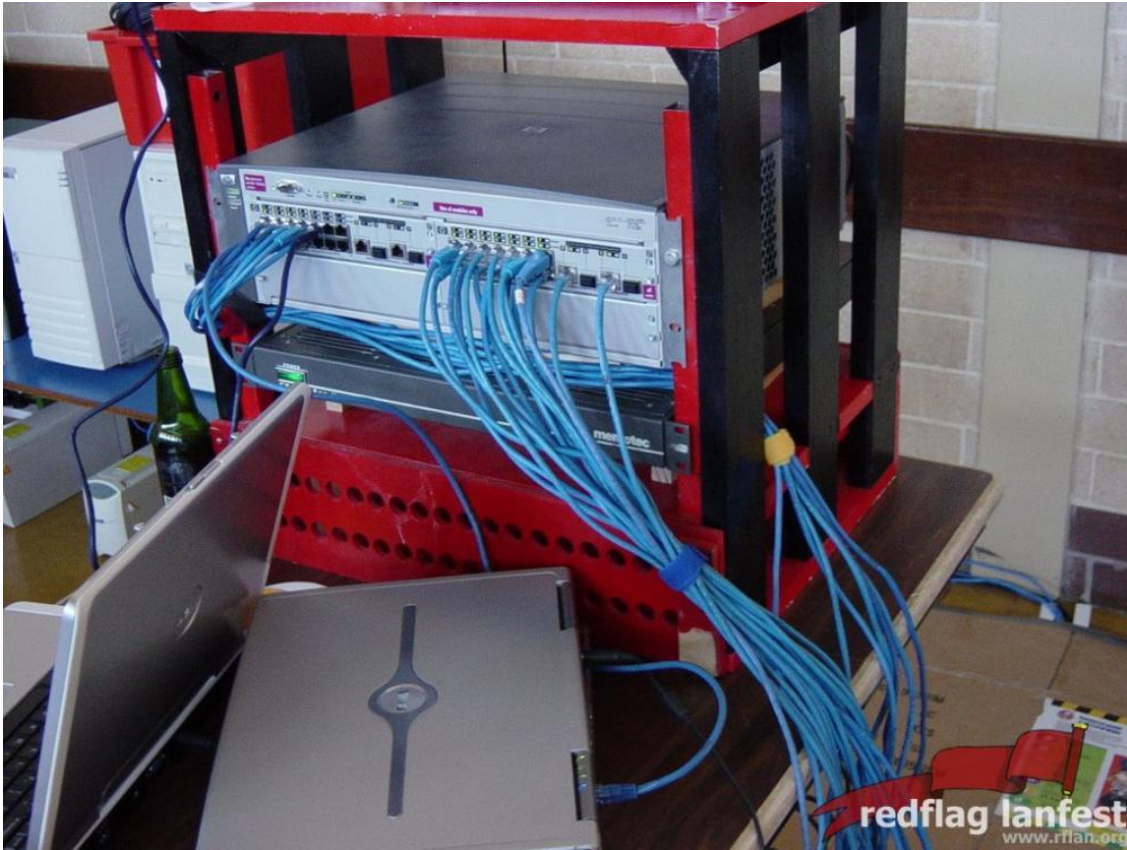

## Circa RFLAN 10 (~2005)

- Competitor events were running 100Mbit switches with 1Gbit uplinks
- HP ProCurve 5304xl-32G for a core and Netgear GS724Ts for access
  - Original purchase price for the HP = \$6,222
- HP Pentium 4-based laptops used as servers

# Moving to Full Gigabit

Circa RFLAN 10 (~2005)

# Gaining Popularity

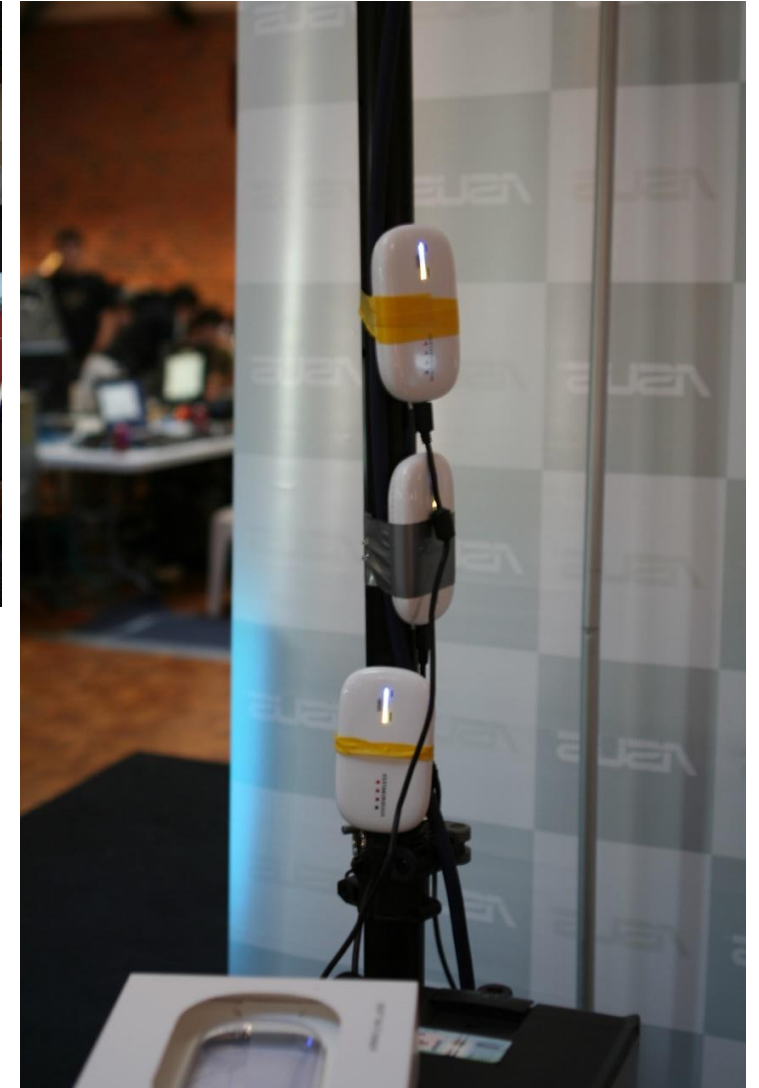

Circa RFLAN 30 (~2010)

---

- Filling more and more of the Cannington Exhibition Centre
  - Taking up adjacent rooms to accommodate ~**400 people**
- Sponsor installed ADSL to the venue for us, but use was limited to ensure it wasn't overwhelmed
- Accompanied the ADSL with the... ***Leaning Tower of Vivid Power***
  - It didn't work at scale for AusNOG in 2017, and certainly didn't work for us either in 2010 ;-)
  - Also needed periodic modem swaps, once they ran out of quota!
- **Creative iptables rules** were required to split traffic across the internet options and manage congestion.
  - Vivid / WiMAX for HTTP Proxy + Cache, DSL for everything else.

# Gaining Popularity

Circa RFLAN 30 (~2010)

# New Venue, New Network

Circa RFLAN 35 @ Curtin University Stadium, Bentley

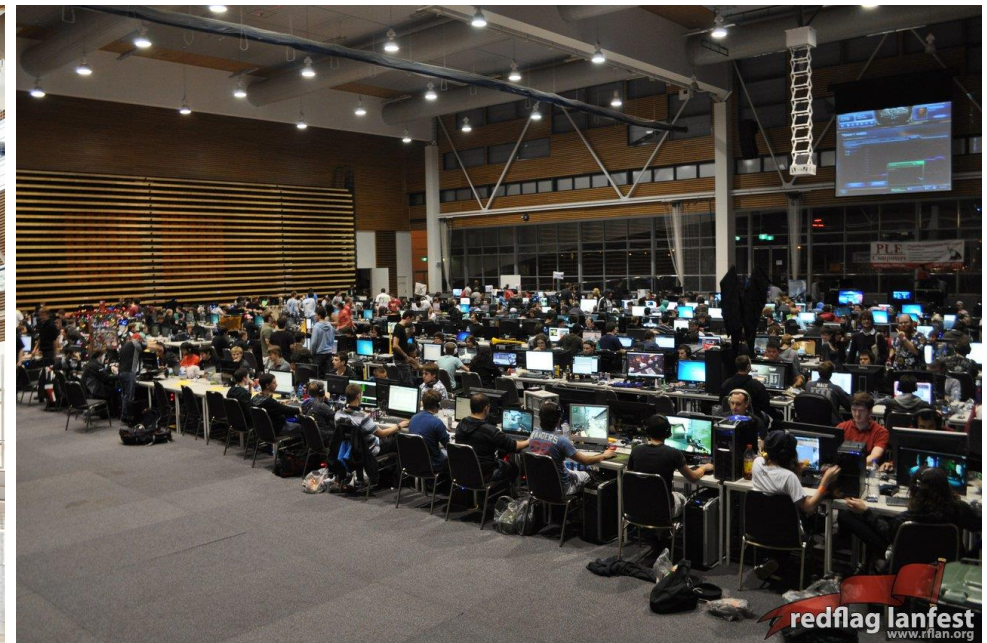

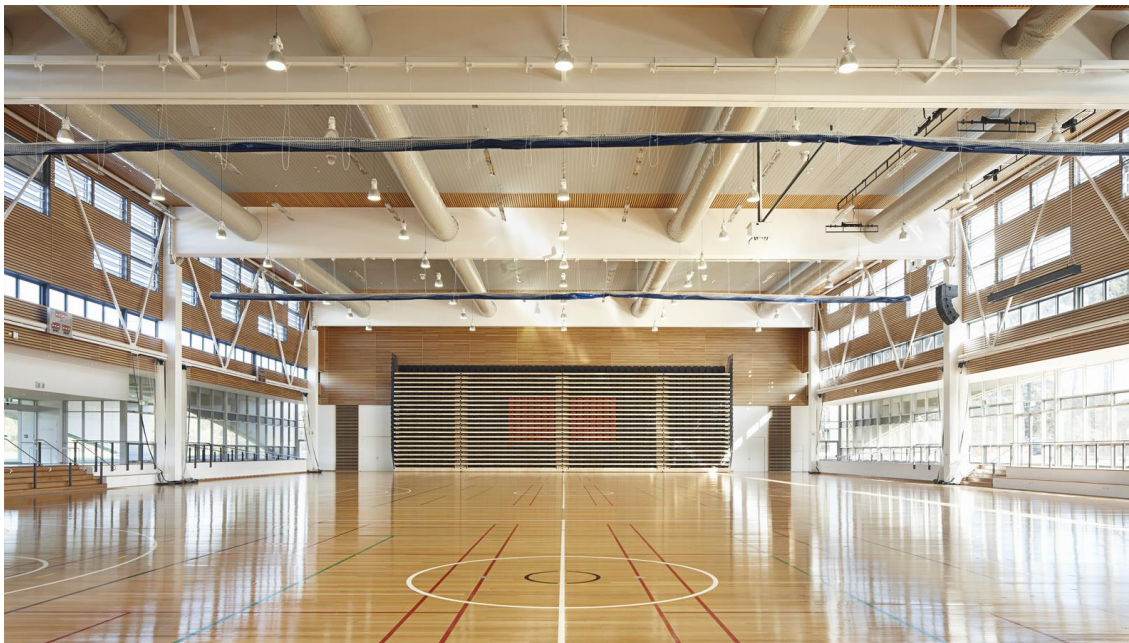

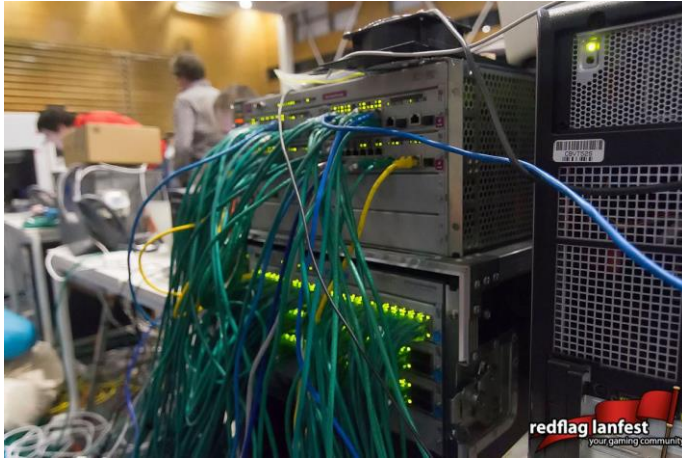

---

- As the event got bigger, we *started* to **actually** engineer the network instead of *#yolo*
  - Netgear table switches were replaced with HP 1810s
  - Uplinks upgraded to 4x 1G LAG from each table to the core using ‘magic’ HP auto-LACP business
- But, we weren’t there **yet**:
  - **Still** no real monitoring of the network, due to slow switch CPUs and poor SNMP MIB support
  - **Still** no STP, so loops still killed the whole network
  - **Still** no routing due to games needing Layer 2 adjacency for discovery
- Internet upgraded to a **40/40 fibre service** delivered on the **other side of the Curtin Campus**
  - Favours were required to get patched cross-campus to the Stadium
- Core Network “Upgrade”
  - We managed to max out the backplane on the HP 5304xl, so a 5408zl (and friends) arrived

# New Venue, New Network

## Circa RFLAN 35

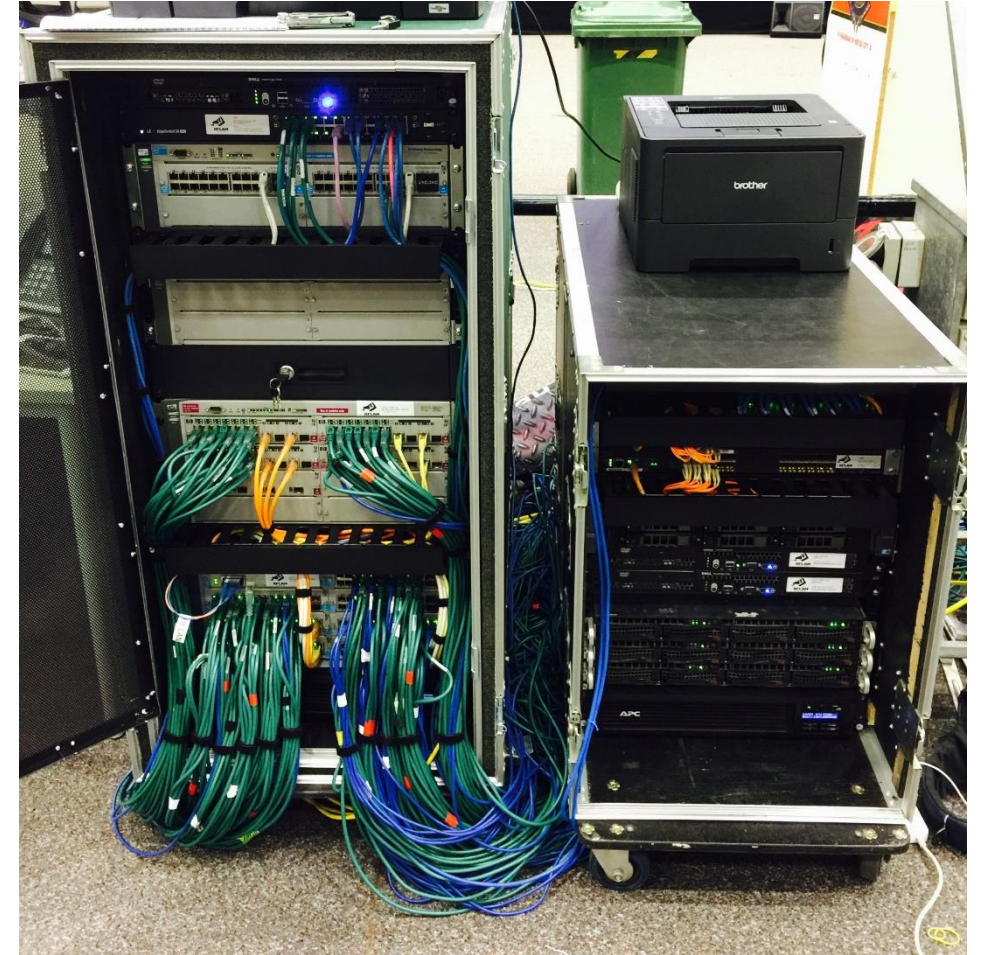

# New Venue, New Network

# New Venue, New Network

## Circa RFLAN 35

# Incremental Improvements

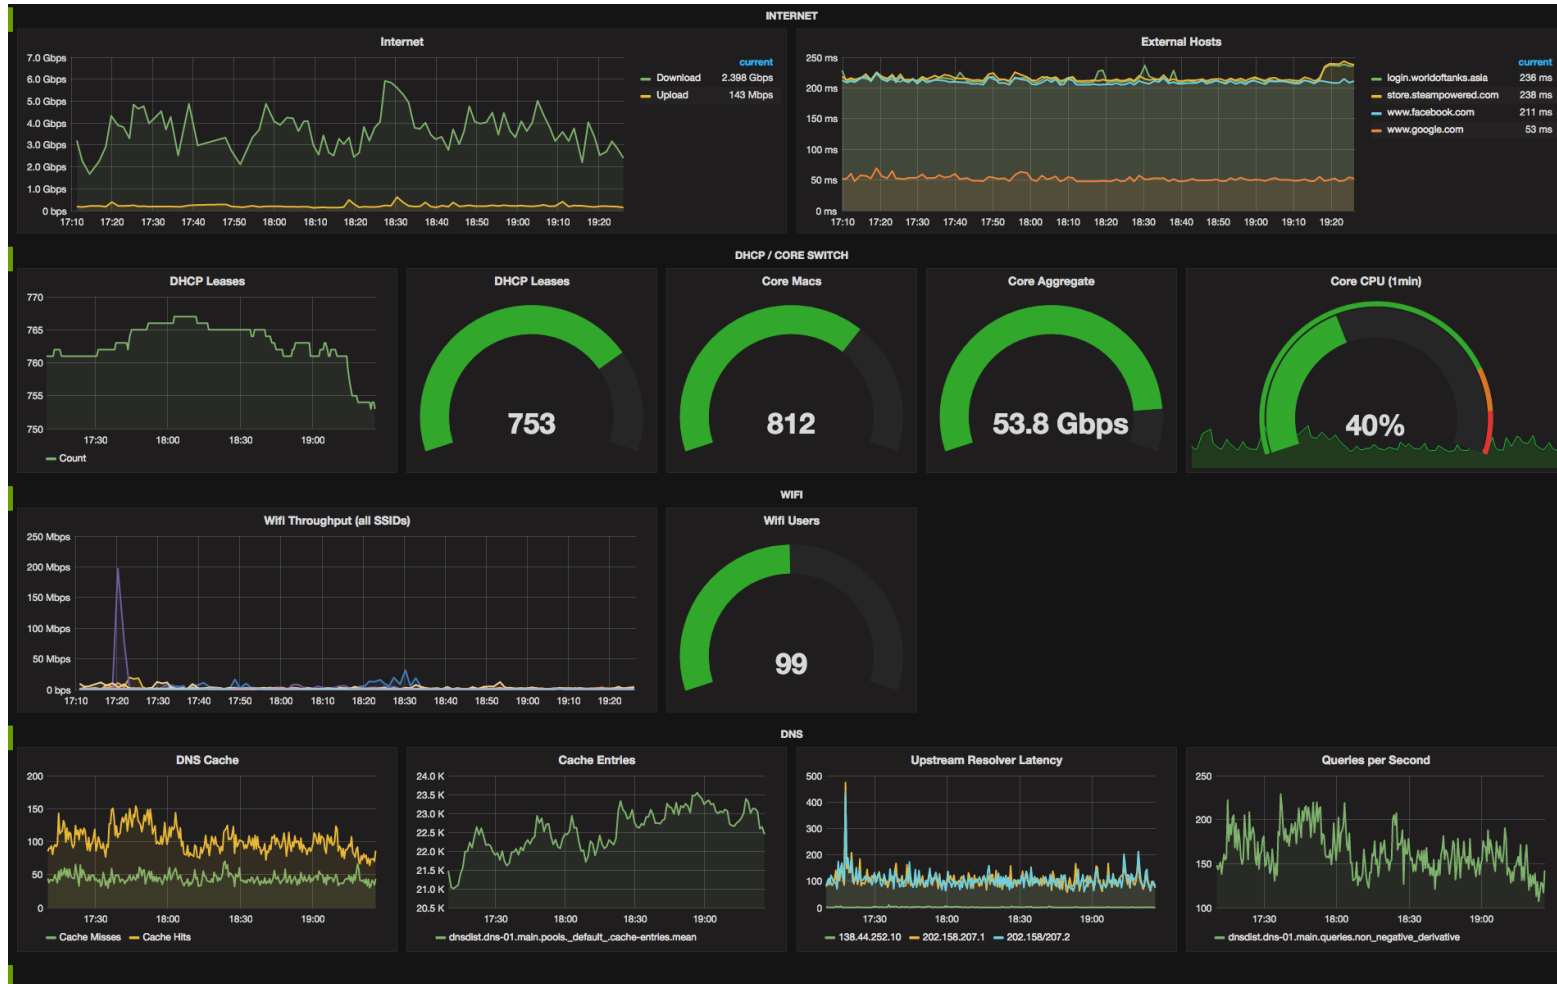

RFLAN 44 (2013) – RFLAN 55 (2016)

- Decided to beat the NBN at their own game with FTTLP (Fibre to the LAN Party)
  - 10Gbit fibre internet installed to the venue - thanks **AARNet!**
  - Resolved a large number of internet issues, but others still persisted
  - Game updates killed the link, so we **rolled our own caching servers** (Steam)
  - **Cisco 4506-E** procured to replace the long-serving HP ~~Slow~~ProCurves
- RFLAN 55 (**792 people!**) highlighted major challenges, resulting in a proposal to fully redesign the network
  - Major issues with the **venue power** – earth leakage is a pain...
  - **Loops** repeatedly **killing the network**
  - Lack of full visibility into performance and conditions = **network wack-a-mole**

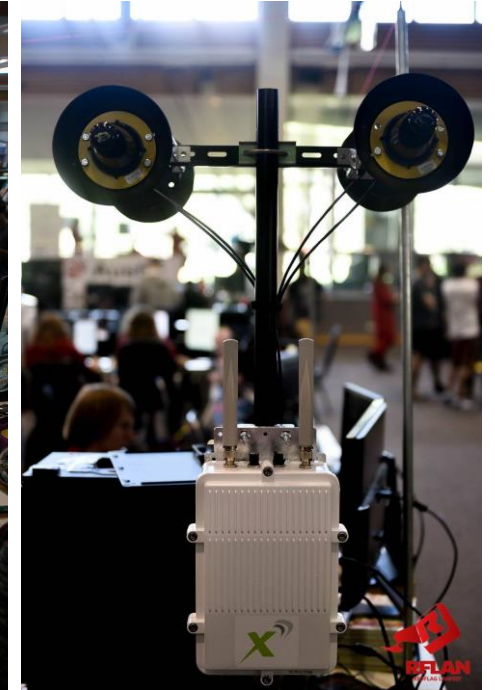

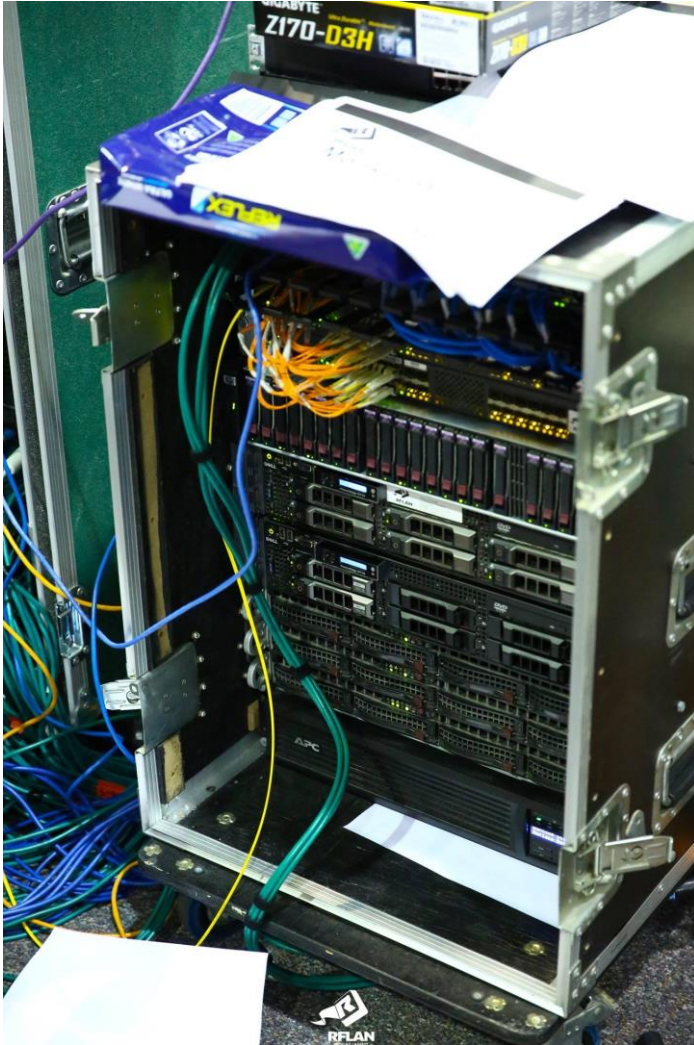

# Incremental Improvements

## RFLAN 44 (2013) – RFLAN 55 (2016)

# Incremental Improvements

## RFLAN 44 (2013) – RFLAN 55 (2016)

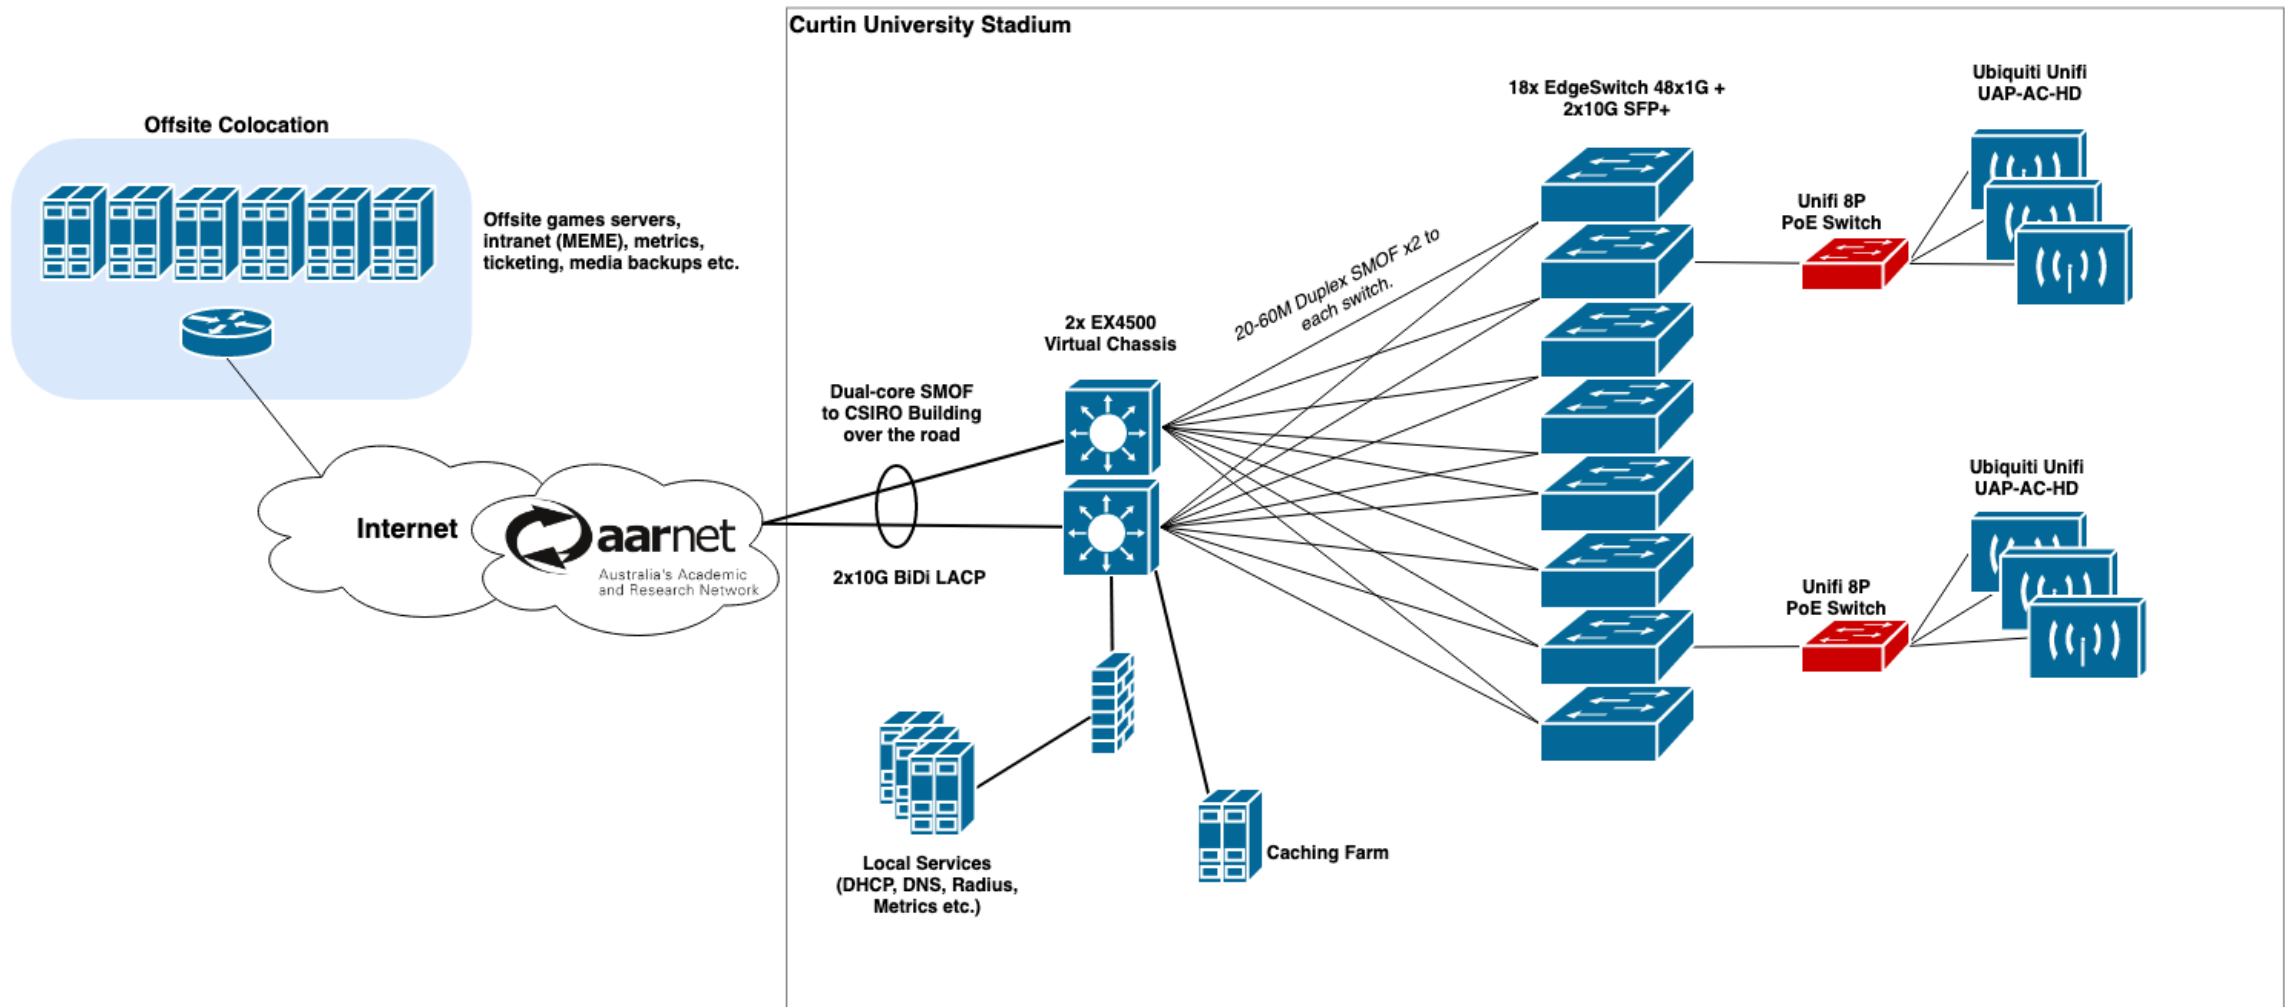

***“We’ve duct taped as much of the network together as we can to get us by until 10Gig was affordable... and now it is, so let’s DO IT!!”***  
***-Shane Short, RFLAN Network Upgrade Proposal TL;DR***

- **BIGGEST** event yet (>800 attendees)!
- Redesigned the network *from the ground up* with some lofty goals
- Implemented **2x Juniper EX4500 cores**, and put **Ubiquiti Edgeswitches** on the tables
  - Allowed for **2x 10G to every desk switch**
    - 20Gbit per 40 attendees vs 4Gbit per 20 attendees – 1:5 over-sub improved to 1:2.4
  - Allowed for **improved monitoring**
    - 30 second SNMP polling of user ports, uplinks, optics, and all of IF-MIB per port.
  - Port security across the network (max MAC limits, broadcast limits etc.)
  - More configuration, more manageable, less issues!
- Internet upgraded to 2x 10Gbit links (thanks AARNet!!) using BiDi optics on existing dark fibre.
- Game servers moved into **offsite colocation** – less to move around, and always on between events.

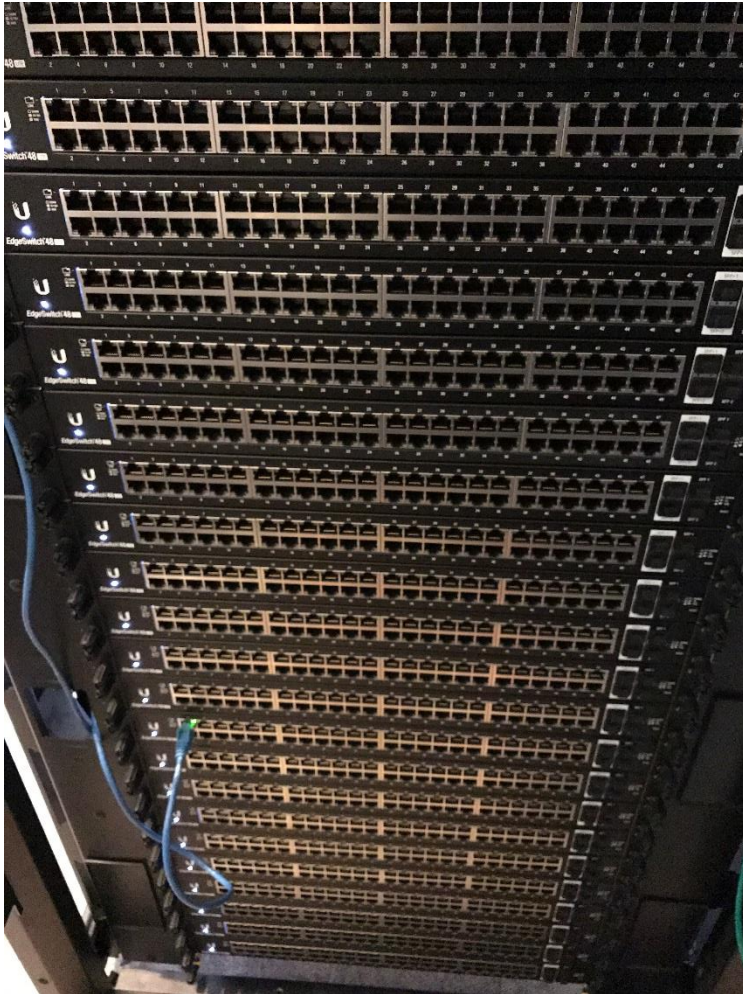

# Engineering for Scale

## RFLAN 56 (2017)

---

# Continued Growth

RFLAN 57 (2017) – RFLAN 63 (2019)

---

- **Wireless network upgrades**
  - 6x Ubiquiti Unifi AP-AC-HD (250 client capability per unit)
  - Needs to compete with venue wireless for spectrum
  - Overkill... maybe, but it works!
- **SAN failure** at our offsite colocation facility on the day of the event...
  - Rebuilt the environment with BBB hardware, at the event, and onto a different platform, with only an hours delay to the overall running of the event
- We **paid** the venue came to **upgrade their power infrastructure**
  - 5x 32A feeds added to the existing 10 feeds – total of 480A across the venue.
  - No more generators!
- **Stream Production**
  - 24 hours of live coverage on [Twitch.tv](https://www.twitch.tv) – Frontpage position for AU on Event-day.
    - Restreamed to YouTube and Facebook.

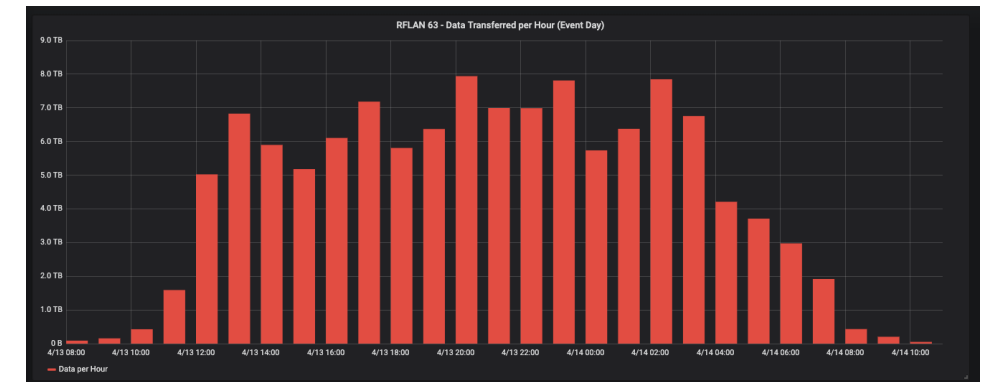

# Continued Growth

## RFLAN 58 (2017) – RFLAN 63 (2019)

# Continued Growth

## RFLAN 58 (2017) – RFLAN 63 (2019)

**120TB** Transferred on **LAN**  
**@ 5TB per Hour** (over 24 hours)  
**15TB** from the **Internet**  
**8TB** from **Steam** (via cache)  
**3TB** to fill the Steam cache

- **Woodhouse – Port security on a budget**
  - Ruby script for ‘smart’ managed switches, built to locate potential loops.
  - Polls MAC tables and alerts via a chatbot providing a mechanism to shut the port.
- LRM -> ALP -> ALP (RFLAN Edition) -> **MEME on Rails**
  - A CRM-esque system, currently on its 4<sup>th</sup> iteration, that drives the event
  - It runs attendee registrations, tournament administration, registrations and bracketing, food orders, announcements/news, and jukebox control
  - The latest version is built in Ruby, by team of in-house volunteer coders
- **Ghetto DRS** on Proxmox
  - Ain’t nobody got money for VMware
  - Load-balancing auto-created CS:GO Servers – upward of 30 at a time
  - <https://github.com/tardoe/ghetto-drs>
- **Steam Cache**
  - Only caches Valve Steam content – no Blizzard, Riot, Epic, Sony, Microsoft, Apple etc.
  - 30:1 caching ratios during the event.
  - 2x10G NICs with 12 Core 2.6Ghz Xeon, NVMe SSD total of > 4TB
  - Performance still a challenge and likely to remain so (but it mostly works)

# So What's Next?

- Event sizing is currently capped at **864 attendees** (+80 sponsors and staff)
- The network has been designed for **scalability** – 60 tables / ~ 2400 lanners(ish)
- Better **metrics and monitoring**
  - Generate efficiencies around troubleshooting and diagnosis
- Event **optimisation**
  - Set up quicker, pack up quicker, provision all the things quicker
- Let's go **national?**
  - Has been investigated – can we bring the fun to Sydney/Melbourne?
  - ...We'll just have to see...

## Brad Peczka

- Gamer
- Infrastructure Architect
- First RFLAN: #8
- Long-standing committee member
- Involved in Incorporation and Governance aspects

## Tim Raphael

- Gamer
- Network Engineer
- First RFLAN: ~ 40s as a lanner
- Experience in Event Networking:
  - ESL – Intel Extreme Masters / Melbourne eSports Open
  - PAX – PC Freeplay Area
  - ~ 15 RFLANs

**\$15 000+ | 700+**  
**OF PRIZES | GAMERS**
