Who needs ARP?

Let's route legacy IP (IPv4) via IPv6 next hops!

[cooper@home1 ~]\$ arp -a

gateway (10.6.9.1) at ac:1f:6b:6f:0d:97 [ether] on eth0 home2.cooperlees.com (10.6.9.3) at 00:e0:67:20:1f:c9 [ether] on eth0 ? (10.6.9.69) at a0:78:17:93:a8:67 [ether] on eth0 ? (10.6.9.8) at 08:00:27:2f:47:9d [ether] on eth0 ? (10.6.9.10) at 14:7d:da:d9:ae:f2 [ether] on eth0 home1.cooperlees.com (10.6.9.2) at ac:1f:6b:6f:0d:97 [ether] on eth0

Cooper Lees Production Engineer James Paussa Real Network Engineer

Agenda

Discuss pros + cons of stopping legacy (IPv4) addressing of your networks today!

Intro

Where is IPv6 @ Meta?

Point to Point Addressing - Why?

Where can I deploy this?

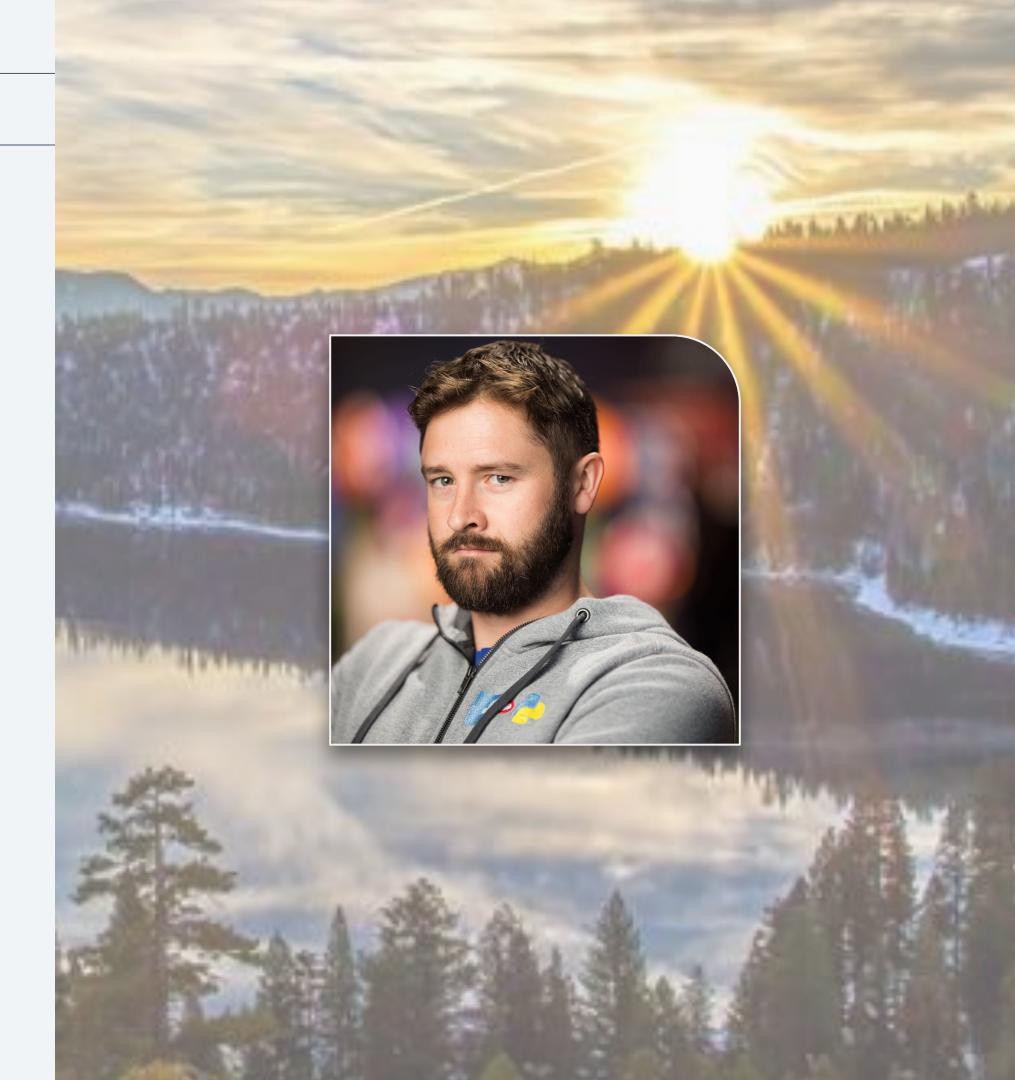

OSS + Vendor Support

Linux IPv4 via IPv6 Demo/Lab

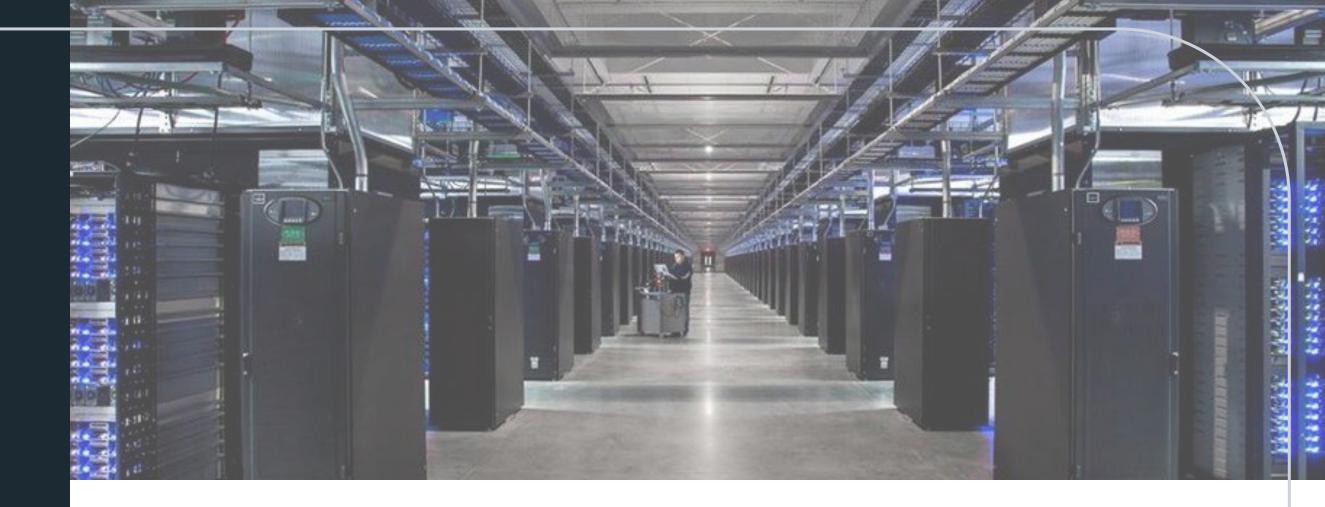

- IPv4 via IPv6 What? How? Why?
- a. <u>https://github.com/cooperlees/v4v6demo</u>

Cooper Lees

- Production Engineer New Operating System Team
- From Wollongong
- Based Remote in South Lake Tahoe, CA
- Former
 - ANSTO + ICT Networks

Meta DC Networks Today

- 10s of regions with 2-6 data halls each
- Each data hall is a CLOS Fabric
- Newer DCs are all FBOSS software • Rack to Datacenter edge

100000s of FBOSS devices

IPv6 in Meta DC Networks Today

- Started going IPv6 only / first in 2013
- Today, all production user traffic is IPv6
- All DC network management is via IPv6

• IPv4 is Layer 7 terminated @ Edge POPs

• Legacy management is dual stacked

IPv6 in Meta DC Networks Today

- The VLAN between
 - server <> switch
 - <u>Side note:</u> In our main Production Fabric

• Servers DHCPv6 + IPv6 PXE etc. to image

has no ARP/IPv4 today globally

• We do have a dual Stacked Facilities Network @ each region

IPv4 in Meta DC Networks Today

[cooper:rsw008.p104.f01.prn1]\$ fboss vips injectors -N

VIP status on rsw008.p104.f01.prn1 : devbig1035.prn1: 2401:db00:1c:6707:face:0:13e:0+747082

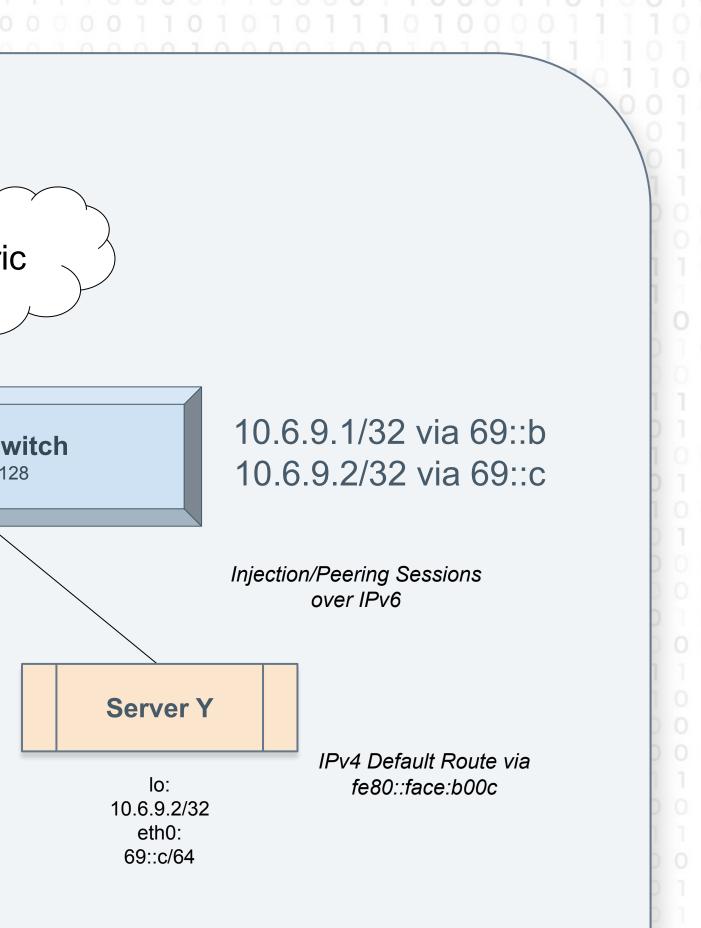

1 injector(s) are connected

[cooper:rsw008.p104.f01.prn1]\$ fboss bgp table | grep -A 1 10.127.30.4 > 10.127.30.4/32, Selected 1/1 paths *@ from 2401:db00:1c:6707:face:0:13e:0 via 2401:db00:1c:6707:face:0:13e:0 LBW None, IGP, LP: VIP HIPRIO/110, ASP: 65000, 69h6m ago

 All production IPv4 is an injected VIP Either via BGP or Thrift to Rack Switch It's last hop is always via IPv6

IPv4 in Meta DC Networks Today

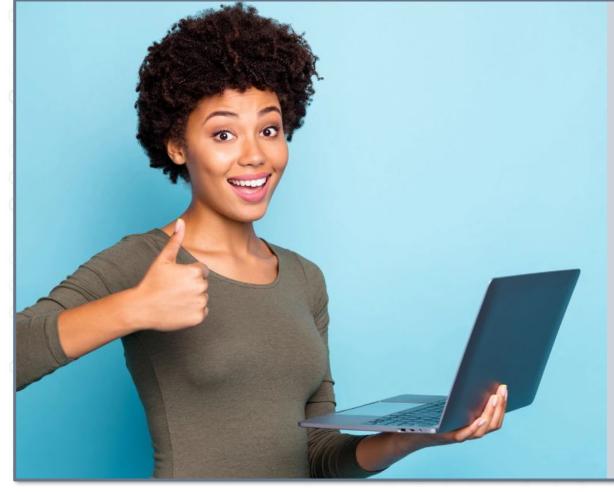

Fabr	
Rack S 69::a/	
Server X	
lo: 10.6.9.1/32 eth0: 69::b/64	
0 1 0 0 0 1 1 1 0 1 0 1 0 1 0 0 1 0 0 1 0 1	0

Point to Point Addressing

Why have p2p addresses?

Point to Point Addressing

- To have next hops to route to
 - Get per link resolution
- Address Family as the next-hop.

 Obtain ICMP responses from ingress interface Traditionally prefix has always been the same

Why have p2p addresses?

Host

- 1. ns1rtr1-ten-lan.binarylane.cloud
- 2. as7575.nsw.ix.asn.au
- 3. et-4-3-0.pe1-brwy-nsw.aarnet.ne
- et-1-1-0.pe1.mcqp.nsw.aarnet.ne 4.
- et-0-3-0.pe1.eskp.nsw.aarnet.ne 5.
- et-5-3-0.pe1.wmlb.vic.aarnet.ne 6.
- 2001:388:cf0c:e::2 7.
- (waiting for reply) 8.
- (waiting for reply) 9.
- 10. mirror.aarnet.edu.au

- - most cases?

	Loss ⁸	Snt	Last	Avg	Best	Wrst	StDev
d	3.4 %	29	0.3	1.0	0.2	9.0	2.0
	0.0%	29	1.6	2.7	0.9	20.4	4.2
t.au	1 0.0%	29	1.2	2.5	1.0	14.3	2.7
t.au	1 0.0%	29	5.3	2.5	1.4	11.1	2.4
t.au	1 0.0%	29	13.4	14.5	13.4	19.4	1.9
t.au	a 0.0%	29	34.8	15.5	13.3	34.8	4.3
	0.0%	29	13.6	14.1	13.5	19.2	1.5
	0.0%	28	13.4	14.1	13.4	18.4	1.3

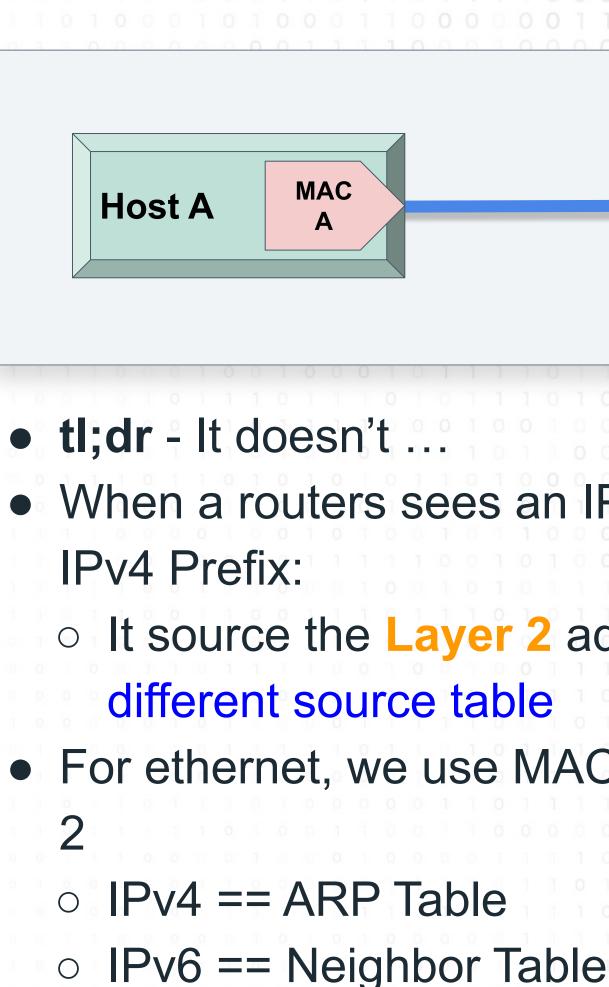

• Do we need that resolution everywhere? Would responses from loopbacks be fine in Is the hop before enough information?

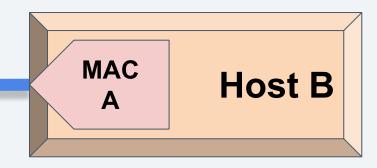

IPv4 via IPv6

Disclaimer: We are only addressing directly connected routers + IP routing today ...

So how does IPv4 route via IPv6??

IPv4 via IPv6

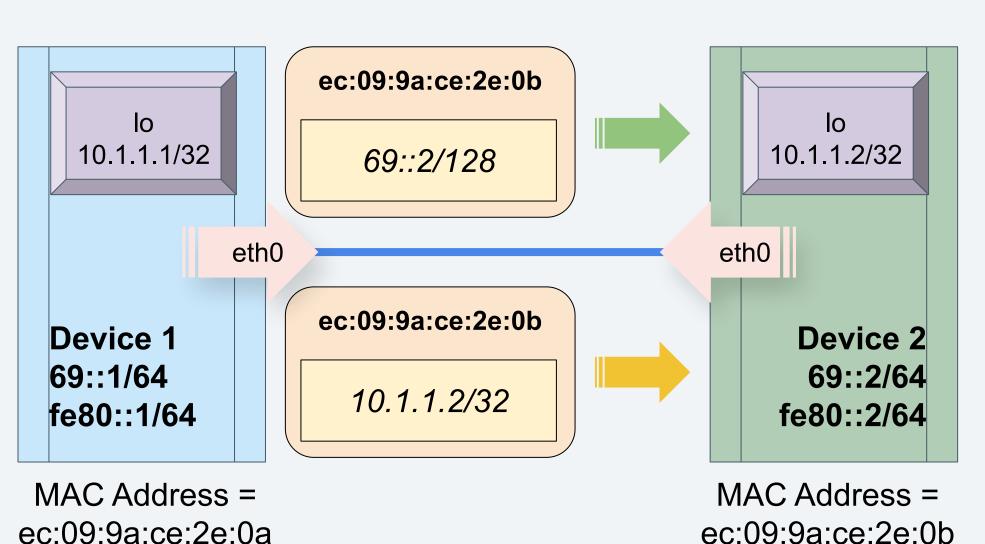

When a routers sees an IPv6 next hop for an It source the Layer 2 address from a For ethernet, we use MAC addresses for Layer

Logically point to point

IPv4 via IPv6

From Device 1 to talk to IPv4 on Device 2

ec:09:9a:ce:2e:0a

To the receiver ... it looks the same ... same destination MAC address

ip -4 route add 10.1.1.2/32 via inet6 69::2 ip -4 route add 10.1.1.2/32 via inet6 fe80::2 dev eth0

IPv4 needs an IPv4 nexthop ...

IPv4 via IPv6 in Linux Kernel since 5.2 [cooper:~]\$ ip -4 route

routes

default via inet6 fe80::face:b00c dev eth0 src 10.6.9.9

 Nope - Not anymore. IPv6 Link Local must have interface defined on

What is a L2 table?

IPv6 on Linux

[cooper:~]\$ ip neighbor show

2401:db00:69:6969:face:0:69:0 dev eth0 lladdr ec:0d:9a:ce:b2:42 STALE

fe80::face:b00c dev eth0 lladdr 02:90:fb:61:5d:47 router REACHABLE

IPv4 on Linux

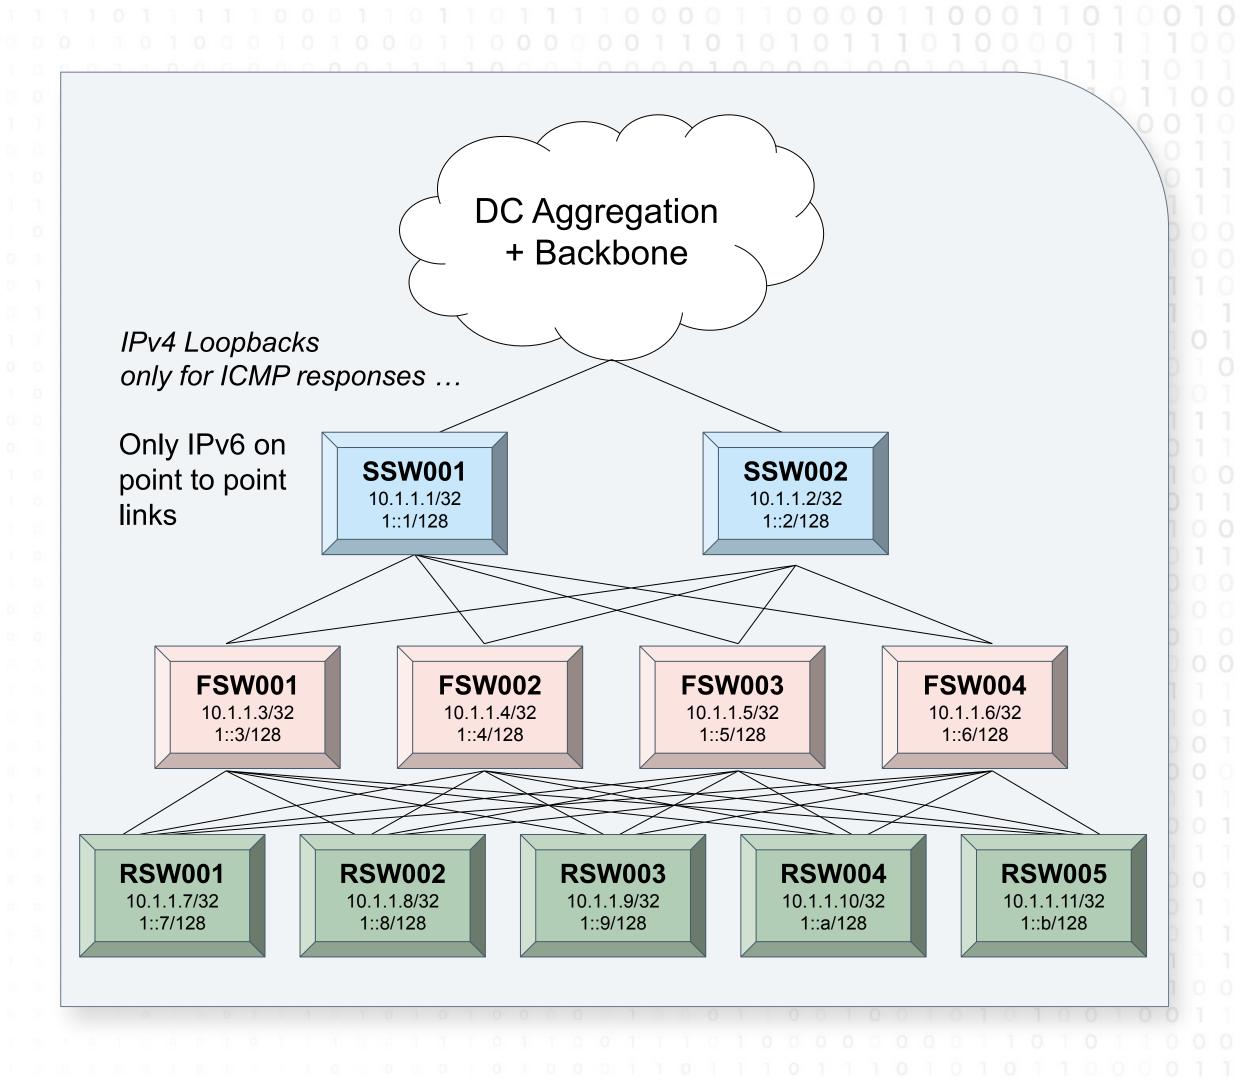

[cooper:~]\$ arp -an

? (169.254.0.10) at 02:90:fb:61:5d:47 [ether] on eth0

Yes, I know `arp` is deprecated. So is IPv4 ip -4 neighbor show

Logically a DC

IPv4 via IPv6

Meta DC

IPv4 via IPv6

	[0	:00	ope	er	:~]\$	m	tr	_	4 :	rs	w0	48	-i:	nba	ano	d.]	p08	80

Dynamic Routing Protocols + v4 via v6

IPv4 via IPv6

Host B BGP

• Has RFCs for MP-BGP IPv4 via IPv6

BGP RFCs

• RFC5549 (200905 - obsoleted) MP BGP allow IPv6 NLRI (Network Layer Reachability Information) for IPv4 prefixes • Use cases IPv4 Islands over IPv6 only cores IPv4 VPNs over IPv6 Cores • Must advertise capability to peers

BGP RFCs

IPv4 via IPv6

 RFC8950 - 202011 Changes the next-hop address encoding to a VPN-IPV6 address (from 5549) From 16/32 bytes to 24/48 bytes -"Extended Next Hop Encoding Capability" Adds ability for IPv4 VPN Multicast over IPv6 core Interoperable with 5549 peers

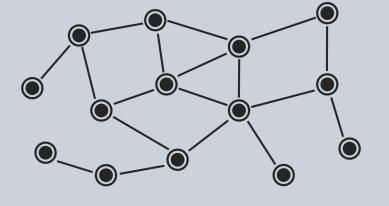

IPv4 via IPv6 Dynamic Routing @ Meta

IPv4 via IPv6

BGP++

 In house C++ BGP daemon "BGP++" • Has non VPN RFC5549 capability Open/R our Link State IGP • Config option to enable IPv4 prefixes with IPv6 next hops • Arista + Cisco Interop @ Edge POPs interoperating with FBOSS (BGP++) and servers injection via BGP E.g. <u>www.facebook.com</u> VIPs

OPEN ROUTING

How can I deploy?

IPv4 via IPv6

- 2 addressing options Address Point to Point Links with Site Scope IPv6 Global Scope IPv6 Use IPv6 Link Local ■ fe80::/10
 - Gateway

 Common link local addressing for Default • e.g. fe80::1 (uplink) fe80::2 (downlink)

Potential Use Cases

ISP point to point links

Especially if a customer is only receiving a /32

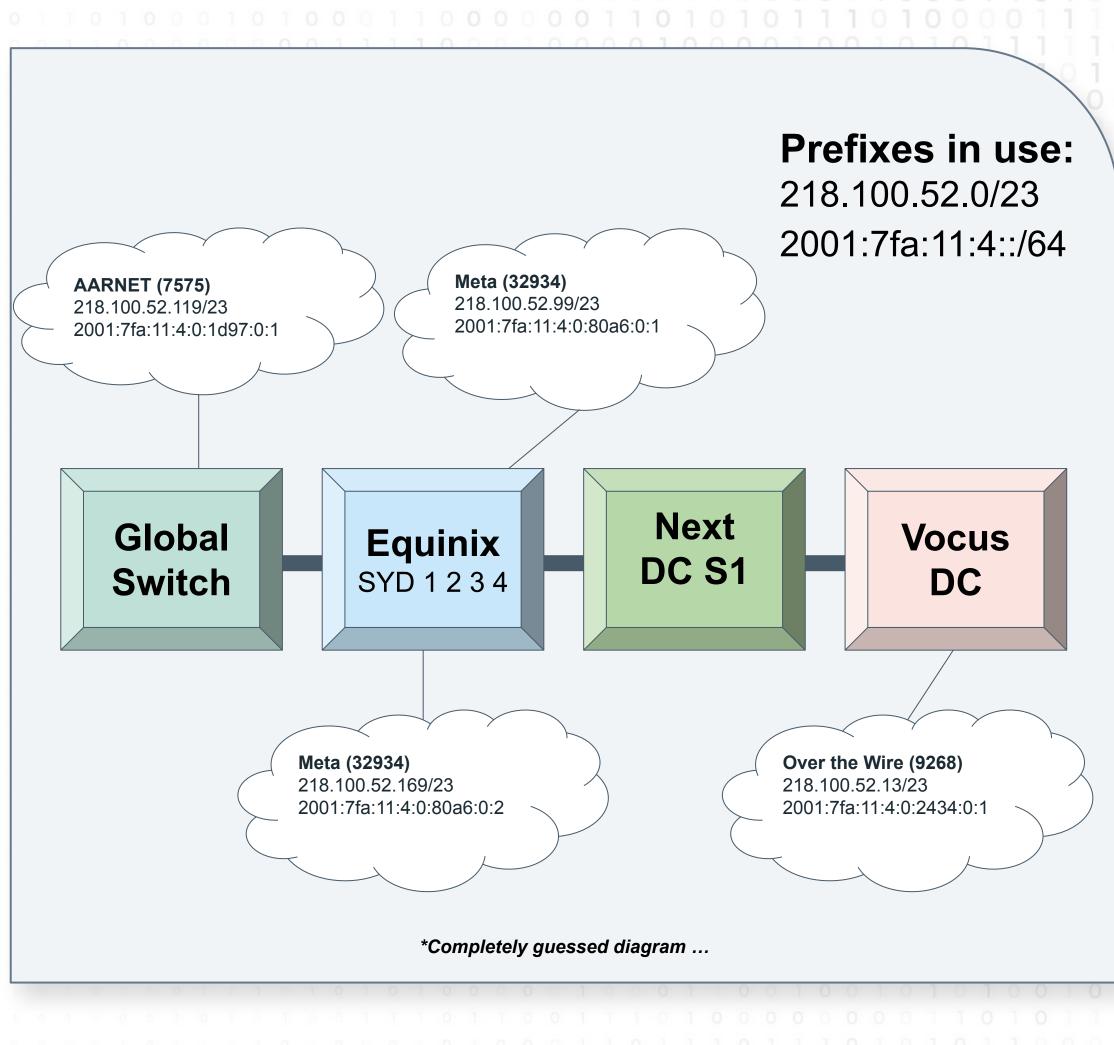

Peering Exchanges

Just route the v4 over the v6 /64

Server Access network/vlan

IPv6 Static address
Autoconf / DHCPv6
And route to those addresses ...

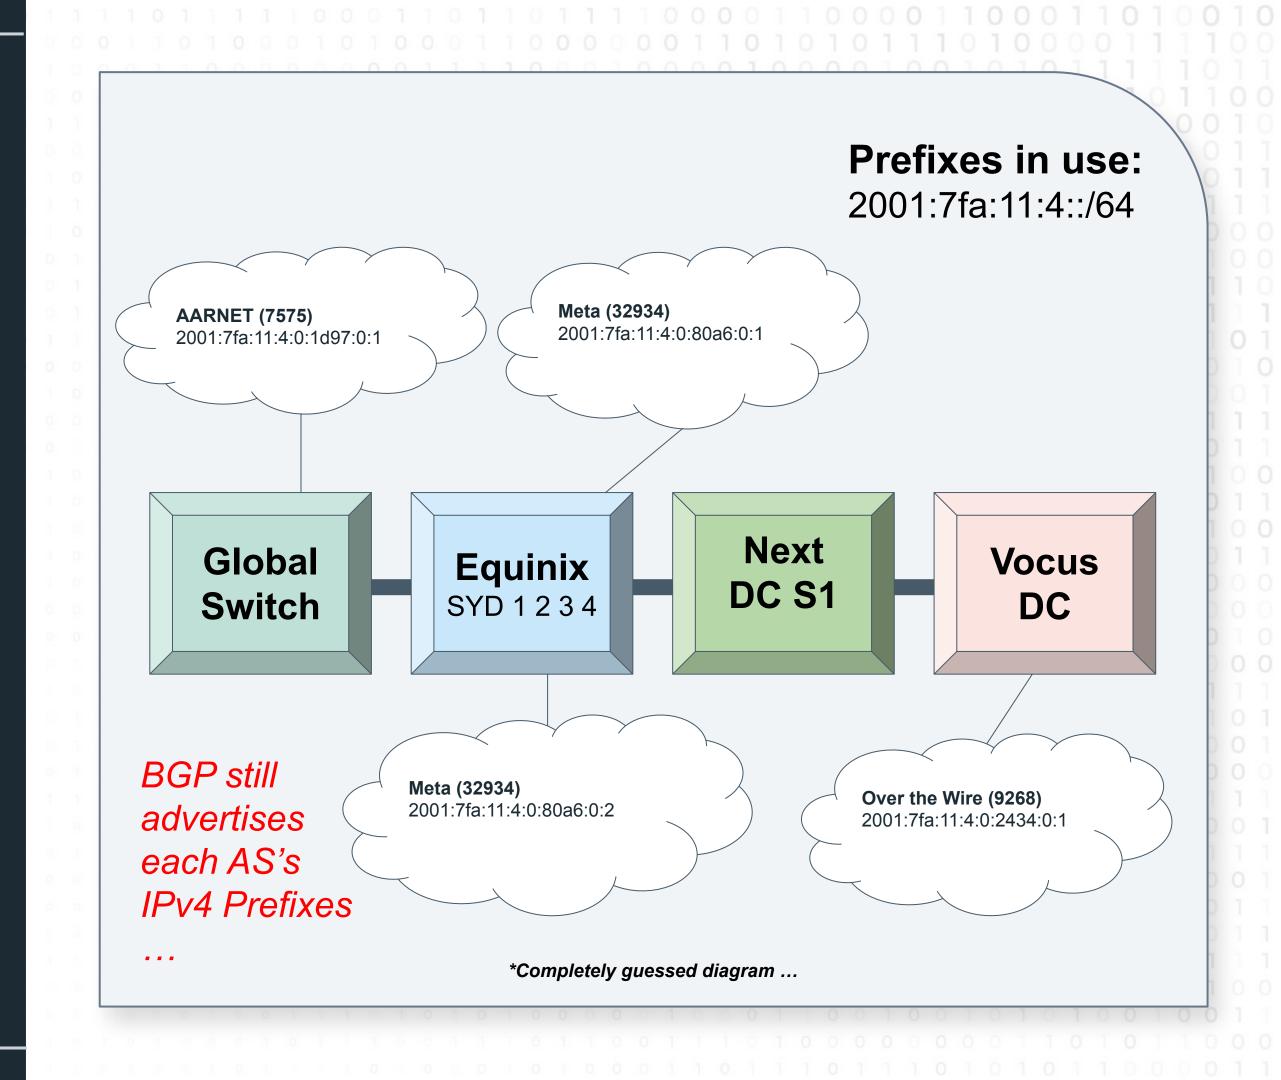

Case Study -NSW IX: Potential **Use Case**

IPv4 via IPv6

Case Study -NSW IX Remove IPv4...

IPv4 via IPv6

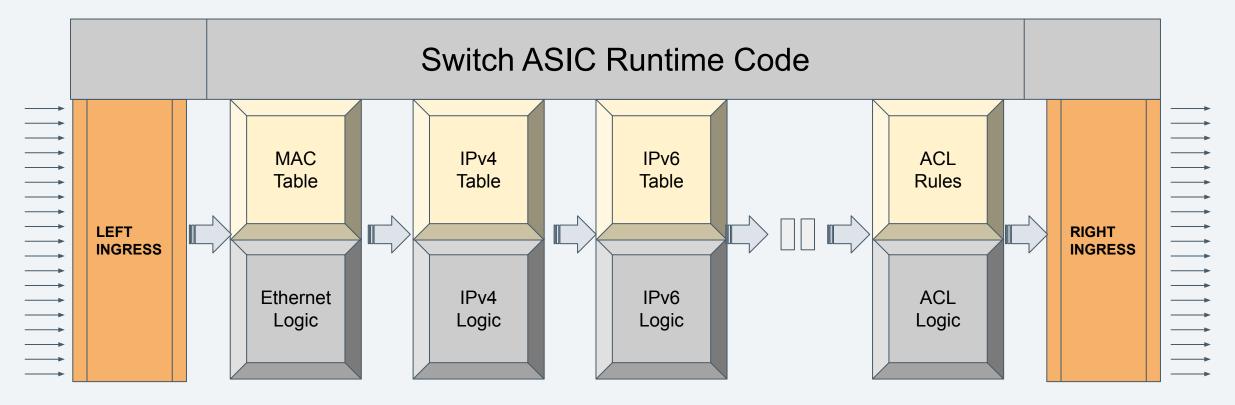

Case Study -NSW IX

- We get a /23 back ...
 - This is just one IX
 - Maybe need some loopbacks ..
- No *tunneling* so full MTU ...
- Downsides
 Loss of interface resolution for traceroute
 CPE needs RFC5549/8950 support

Why remove IPv4? Why care?

• #1 - Save Public Space Limit of RFC1918 address e.g. Meta has almost used all of 10.0.0/8 (and that's with no servers getting v4 for many years) Turn off allocating resource for IPv4 in ASICs No v4 store for ARP needed • Create more IPv6 FIB capacity FIB = Forwarding Information Base

Reason to remove IPv4

Why remove IPv4? Why care?

Fixed-Function Switch ASIC Packet Pipeline

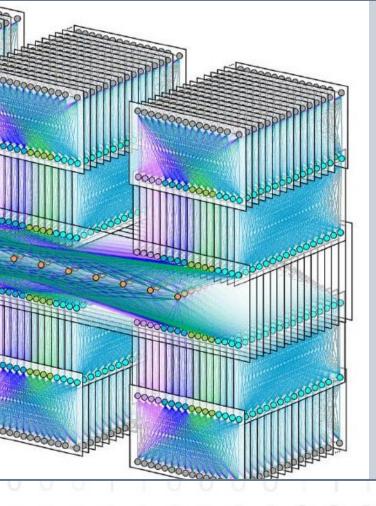

Start with less tech debt + Save Addressing

> • Use IPv6 on point to point links only Could even use IPv6 Link Local • Less addressing to allocate • We can dream - One day we may not even need IPv4 addressing to remove!

Our New Region Designs

- Meta's Fabrics are only planned to only get larger
- That's more IPv4 for
 - Loopbacks
 - Point to point links
- Plan: use the same IPv4 Loopback prefix for each new Fabric being turned up (for ICMP replies)

Why even IPv4?

IPv6 Globally

Why even IPv4?

IPv6 Adoption

https://www.facebook.com/ipv6/?tab=ipv6 total adoption

 35% of Meta's global users are IPv6 users • Includes Instagram, WhatsApp etc.

Sep 2017Dec 2017Mar 2018Jun 2018Oct 2018Jan 2019Apr 2019Jul 2019Nov 2019Feb 2020May 2020Aug 2020Dec 2020Mar 2021Jun 2021Sep 2021Jan 2022Apr 2022

IPv6 in Straya

Why even IPv4?

Australia

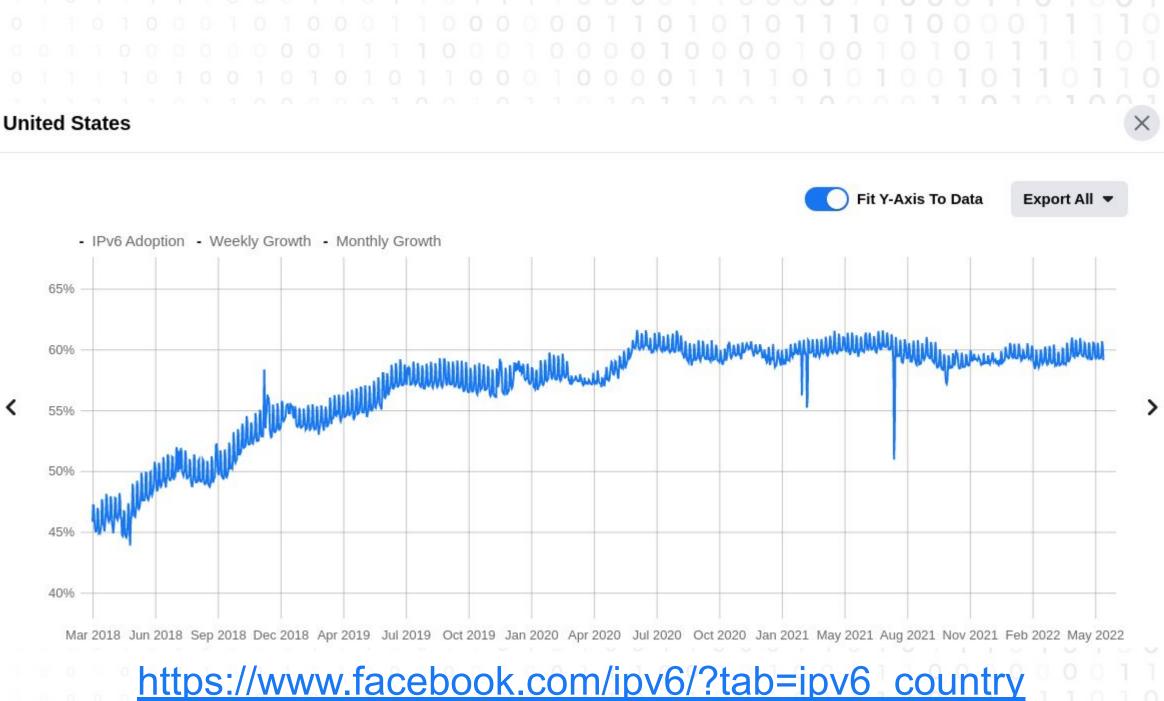

• 32% of Meta's AU users are IPv6 users • Catch up people!

https://www.facebook.com/ipv6/?tab=ipv6 country

IPv6 in Murica 🐓

Why even IPv4?

• 60% of Meta's US users are IPv6 users • Can't let the yanks better us! Mainly mobile networks pushing this up Ο

Things that won't go away for a long time ...

- Edge IPv4 VIPs
- IPv4 (dual stacked) Proxy Servers
- Some Data Center controlling hardware
 - E.g. temperature sensors
- We're pushing all our V4 to edge POPs only

Demo / Lab

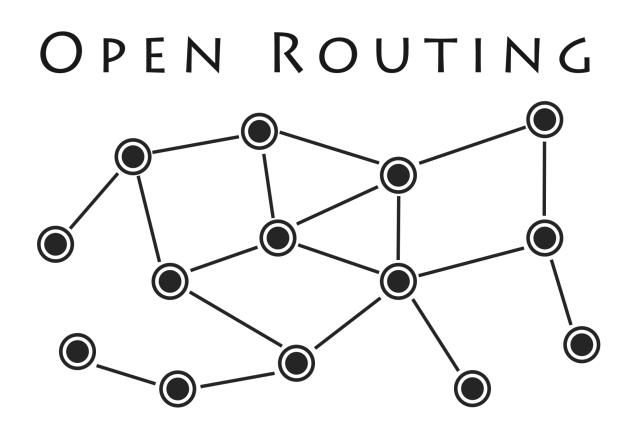

Risky Live demo time ...

Labs are fun!

 <u>https://github.com/cooperlees/v4v6demo</u> • We create two Network Namespaces • The get a v6 point to point link We add routes to make the IPv4 address on lo reachable! *Potentially guaranteed you'll become a Network god!

Open/R v4 via v6

- Facebook's Open/R also has a similar lab
 - But you'd need to build Open/R from source
- bs/001 point to point loopback
 - https://github.com/facebook/openr/tree/main/openr/orie/la

We don't always need to have IPv4 addressing on point to point links now ... a. Let's save the tech debt where it makes sense Think IPv6 first with all new systems If you're not Dual Stacked, please, prioritize it Try IPv4 via IPv6 in your labs today!

Questions?

THANK YOU FOR YOUR TIME
